**Exercise E2 Electrostatics I**

(written test, approx. 10 % of a 120-minute written test, SS2022)

2. What has been given to you? The charges are  $q_1 = 1 \text{ nC}$ ,  $q_2 = 1 \text{ nC}$ ,  $q_0 = 1 \text{ nC}$ ,  $q_4 = 1 \text{ nC}$ . The value of the point charge  $q_0$  is  $1 \text{ nC}$ . Which value needs  $E_4$  to have to get a resulting force of  $0 \text{ N}$  on  $q_0$ ?

Path:  $q_0 = 1 \text{ nC}$

- $q_1 = 2 \text{ nC}$

Path:  $E_4 = 2310.97 \text{ (V/m)}$

- $\vec{F}_{01} = \left( \begin{array}{c} 19.97 \\ 0 \\ 0 \end{array} \right) \text{ (}\mu\text{N)}$

In the  $x$ -direction the force components are  $F_{01,x} = 19.97 \text{ (}\mu\text{N)}$ . The force  $F_{02}$  is purely in the  $y$ -direction  $F_{02,y} = 8.854 \text{ (}\mu\text{N)}$ . The force  $F_{03}$  is purely in the  $x$ -direction  $F_{03,x} = 10.05 \text{ (}\mu\text{N)}$ . Here, this  $F_{03}$  must be added to the force  $F_{01}$  from  $q_1$  on  $q_0$ :

$$|\vec{F}_{01}| = |E_4| \cdot |q_0| \Rightarrow E_4 = \frac{|\vec{F}_{01}|}{|q_0|} = \frac{19.97 \cdot 10^{-6} \text{ (}\mu\text{N)}}{1 \cdot 10^{-9} \text{ (nC)}} = 19.97 \cdot 10^3 \text{ (V/m)}$$

1. Calculate the single forces  $\vec{F}_{01}$ ,  $\vec{F}_{02}$ ,  $\vec{F}_{03}$ , on the charge  $q_0$ !

Path

First, calculate the magnitude of the forces, like  $\vec{F}_{01}$ .  
 The force  $\vec{F}_{01}$  is purely on the  $x$ -axis and therefore equal to  $F_{01,x}$ .  

$$\vec{F}_{01} = F_{01,x} \hat{x} = \frac{1}{4\pi\epsilon_0} \cdot \frac{q_1 \cdot q_0}{r_{01}^2} \hat{x} = \frac{1}{4\pi \cdot 8.854 \cdot 10^{-12} \text{ (As/Vm)}} \cdot \frac{1 \cdot 10^{-9} \text{ (nC)} \cdot 2 \cdot 10^{-9} \text{ (nC)}}{(3 \cdot 10^{-2} \text{ (m)})^2} \hat{x} = 19.97 \cdot 10^{-6} \text{ (}\mu\text{N)}$$

$\cdot 10^{-6} \text{ \textit{VAs} \over m} = 19.97... \cdot 10^{-6} \text{ \textit{Ws} \over m} \quad \&= 19.97... \text{ \textit{\mu N}} \quad \text{\textit{(to the right)}} \end{align*}$

Similarly, we get for  $\vec{F}_{02}$  and  $\vec{F}_{03}$   $\begin{align*} \vec{F}_{02} = F_{02,x} \quad \&= -28.09... \text{ \textit{\mu N}} \quad \text{\textit{(to the right)}} \quad \backslash \backslash \\ \vec{F}_{03} \quad \&= -22.47... \text{ \textit{\mu N}} \quad \text{\textit{(to the top left)}} \quad \backslash \backslash \end{align*}$

For  $\vec{F}_{03}$ , we have to calculate the  $x$ - and  $y$ -component.

This is possible, by using the angle  $\alpha$  between the line through  $q_0$  and  $q_3$  and the positive  $x$ -axis (pointing to the right).

So,  $\alpha$  has to be between  $90^\circ$  and  $180^\circ$ . It can be calculated by:

$\begin{align*} \alpha = \arctan\left(\frac{-4 \text{ cm}}{+2 \text{ cm}}\right) = \pi - 1.1071... = 180^\circ - 63.4...^\circ = 116.6...^\circ \end{align*}$

Based on this, the  $x$ - and  $y$ -component is:  $\begin{align*} F_{03,x} \quad \&= |\vec{F}_{03}| \cdot \cos \alpha = 10.05... \text{ \textit{\mu N}} \quad \text{\textit{(to the left)}} \quad \backslash \backslash \\ F_{03,y} \quad \&= |\vec{F}_{03}| \cdot \sin \alpha = 20.10... \text{ \textit{\mu N}} \quad \text{\textit{(to the top)}} \quad \backslash \backslash \end{align*}$
