Exercise E20 Conversion: Energy, Power and Area

2. The number of solar panels and the length of the roof of a car (100 km) average 100 kWh per day and an usable battery capacity of 60 kWh. Solar panels produces per \$1 m^2\$ in average in December 0.2 kWh/m^2\$. The car is driven 50 km per day. The size of a distinct solar module with 460 Wp (Watt peak) is 1.9 m times 1.1 m.

```

\begin{align*}
A &= 100 \text{ km} \cdot 1.1 \text{ m} = 110 \text{ km} \\
\end{align*}

```

.. What is the average power consumption of the car per day?

```

\begin{align*}
A &= 20 \text{ panels} \cdot 460 \text{ Wp} = 9200 \text{ W} \\
P &= \frac{16 \text{ kWh}}{100 \text{ km}} \cdot 50 \text{ km} = 8 \text{ kWh} \\
\end{align*}

```

```

\begin{align*}
\frac{W}{l} &= \frac{16 \text{ kWh}}{100 \text{ km}} = 0.16 \\
\frac{\text{~ kWh}}{\text{~ km}} \parallel W &= 50 \text{ km} \cdot 0.16 \frac{\text{~ kWh}}{\text{~ km}} = 8 \text{ kWh} \end{align*}

```
