**Exercise E1 Capacitor****(written test, approx. 12 % of a 120-minute written test, SS2024)**

2. With the graph of the magnitude of  $B(r)$  with parameters  $B_0$  of the diagram 4.06 show the cross-section of the cable with  $(0.6 \text{ mm} | 0)$  in the center of the cable. Describe the dimensions and label the diagram.

- Path
- Inner conductor:  $+3.3 \text{ mA}$ ,  $+10 \text{ nC}$  (current into the plane of the diagram)
  - for  $(0.1 \text{ mm} | 0)$ :  $B_{\text{in}} = 5.28 \text{ A/m}^2$
  - Outer conductor:  $-3.3 \text{ mA}$ ,  $0 \text{ nC}$  (current out of the plane of diagram)
  - for  $(0.55 \text{ mm} | 0)$ :  $B_{\text{out}} = 6.985 \text{ A/m}^2$

The magnitude of the electric displacement field  $D$  can be calculated by:  $\int D \cdot dA = Q_{\text{enc}}$ .

In general, the  $B$ -field is proportional to  $\frac{1}{r}$  for the situation between both conductors.

For the situation between the conductors, the enclosed area is the surface of a cylindrical shape (here for simplicity without the round endings). This leads to:  $D(x) = \frac{Q}{A} = \frac{Q}{\pi \cdot r^2}$ .

This is proportional to the area within this radius. Therefore, the formula  $H = \frac{B}{\mu_0}$  is used.

So, we get for  $B_{\text{in}}$  at  $(0.1 \text{ mm} | 0)$  and  $B_{\text{out}}$  at  $(0.55 \text{ mm} | 0)$ . This leads to a formula proportional to  $x$ .

For  $x$  within the outer conductor one also gets a linear proportionality with a  $\begin{aligned} D_{\text{in}} &= \frac{Q}{\pi \cdot r_{\text{in}}^2} = \frac{10 \cdot 10^{-9} \text{ C}}{\pi \cdot (0.1 \cdot 10^{-3} \text{ m})^2} \\ D_{\text{out}} &= \frac{Q}{\pi \cdot r_{\text{out}}^2} = \frac{10 \cdot 10^{-9} \text{ C}}{\pi \cdot (0.55 \cdot 10^{-3} \text{ m})^2} \end{aligned}$

Hint: For the direction, one has to consider the sign of the enclosed charge. By this, we see that the  $D$ -field is positive.

But here, again only the magnitude was questioned!

.. What is the magnitude of the magnetic field strength  $H$  at  $(0.1 \text{ mm} | 0)$  and  $(0.55 \text{ mm} | 0)$ ?

Path

The magnitude of the magnetic field strength  $H$  can be calculated by:  $H = \frac{I}{2 \pi \cdot r}$

So, we get for  $H_{\text{i}}$  at  $r_{\text{i}} = 0.1 \text{ mm}$ , and  $H_{\text{o}}$  at  $r_{\text{o}} = 0.55 \text{ mm}$ :

$$\begin{aligned} H_{\text{i}} &= \frac{I}{2 \pi \cdot r_{\text{i}}} \quad \&= \frac{+3.3 \text{ A}}{2 \pi \cdot \{0.1 \cdot 10^{-3} \text{ m}\}} \quad \& H_{\text{o}} = \frac{I}{2 \pi \cdot r_{\text{o}}} \quad \&= \frac{+3.3 \text{ A}}{2 \pi \cdot \{0.55 \cdot 10^{-3} \text{ m}\}} \end{aligned}$$

Hint: For the direction, one has to consider the right-hand rule. By this, we see that the  $H$ -field on the right side points downwards.

Therefore, the sign of the  $H$ -field is negative.

But here, only the magnitude was questioned!
