Exercise E1 Resonant Circuit
(written test, approx. 4 % of a 120-minute written test, SS2021)

Now the three windings shall be considered in the following.

A voltage with the RMS value $U_{\rm RMS} = 110~\rm V$ is applied between the terminals of each winding.

Through each of the windings, there is a current with an RMS value $I_{\rm RMS} = 5 ~\rm A$ and a phase shift of $\varphi = +25°$ compared to the voltage.

a) Draw the circuit diagram.

b) Specify the RMS value of the phase voltage $U_\rm L$ and the string voltage $U_\rm S$.

c) Calculate the active power.

Result

$W = 1.61~\rm kW$

Path

The active power P is given by: $P = 3 \cdot U \cdot I \cdot \sin(\varphi)$

\begin{align*} P &= 3\cdot 110{~\rm V} \cdot 5{~\rm A} \cdot \sin(25°) \\ &= 1610.888...~\rm W \end{align*}

Result

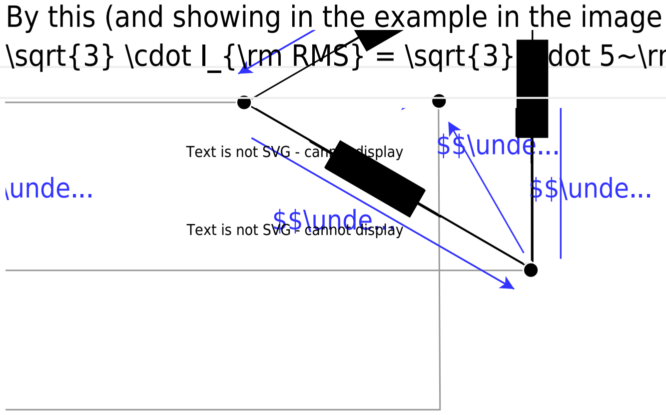
- $U_{\rm S} = 110~\rm V$
- $I_{\rm S} = 5~\rm A$
- $U_{\rm L} = 110~\rm V$

Path

Since the voltage $U_{\rm RMS} = 110~\rm V$ is applied between the terminals of each winding, this is also the string voltage $U_{\rm S}$.

For the phase currents, the three currents at the nodes have to be considered. The sum of all currents must be zero: $\sum_i I_i = 0$.

By this (and showing in the example in the image below), One can see, that $I_\rm L= \sqrt{3} \cdot I_{\rm RMS} = \sqrt{3} \cdot 5~\rm A$



one single phase as an example
