Exercise E20 Conversion: Energy, Power and Area

2. The number of panels and the length of the roof of a car (100 km) average 100 kWh and an usable battery capacity of 60 kWh. Solar panels produces per \$1 m^2\$ in average in December 0.2 kWh/m^2\$. The car is driven 50 km per day. The size of a distinct solar module with 460 Wp (Watt peak) is 1.9 m times 1.1 m.

Result:
$$N = \frac{460 \text{ Wp} \cdot 20 \text{ panels}}{460 \text{ Wp}} = 20 \text{ panels}$$

.. What is the average power consumption of the car per day?

Solution:
$$P = \frac{60 \text{ kWh}}{24 \text{ h}} = 2.5 \text{ kW}$$

Solution:
$$\frac{W}{l} = \frac{16 \text{ kWh}}{100 \text{ km}} = 0.16 \text{ kWh/km}$$

$$W = 50 \text{ km} \cdot 0.16 \text{ kWh/km} = 8 \text{ kWh}$$
