Block 16 - Ampère's Law and Magnetomotive Force (MMF)

Learning objectives

After this 90-minute block, you can

- ...

Preparation at Home

Well, again

- read through the present chapter and write down anything you did not understand.
- Also here, there are some clips for more clarification under 'Embedded resources' (check the text above/below, sometimes only part of the clip is interesting).

For checking your understanding please do the following exercises:

- ...

90-minute plan

1. Warm-up (x min):
 1.
2. Core concepts & derivations (x min):
 1. ...
3. Practice (x min): ...
4. Wrap-up (x min): Summary box; common pitfalls checklist.

Conceptual overview

1. ...

Core content

Generalization of the Magnetic Field Strength

So far, only the rotational symmetric problem on a single wire was considered in formula, when the current I and the length s of a magnetic field line around it is given:

$$\begin{aligned} \quad H_{\varphi} &= \frac{I}{s} = \frac{I}{2 \cdot \pi \cdot r} \quad \Leftrightarrow \end{aligned}$$

$\oint \mathbf{H} \cdot d\mathbf{s} = I_{enc}$ applies only to the long, straight conductor

Now, this shall be generalized. For this purpose, we will look back at the electric field.

For the electric field strength E of a capacitor with two plates at a distance of s and the potential difference U holds:

$U = E \cdot s$ applies to capacitor only

In words: The potential difference is given by adding up the field strength along the path of a probe from one plate to the other.

This was extended to the voltage between two points 1 and 2 . Additionally, we know by Kirchhoff's voltage law that the voltage on a closed path is "0".

$\oint \mathbf{E} \cdot d\mathbf{s} = 0$

We can now try to look for similarities. Also for the magnetic field, the magnitude of the field strength is summed up along a path to arrive at another field-describing quantity.

Because of the similarity the so-called **magnetic potential difference V_m** between point 1 and 2 is introduced:

$V_m = \int \mathbf{H} \cdot d\mathbf{s}$ applies to rotational symmetric problems only

$V_m = \int \mathbf{H} \cdot d\mathbf{s} = \theta$

We need to take a closer look here. Any closed path in the static electric field leads to a potential difference of $\oint \mathbf{E} \cdot d\mathbf{s} = 0$.

BUT: closed paths in the static magnetic field leads to a magnetic potential difference which is **not mandatorily** 0 ! $V_m = \oint \mathbf{H} \cdot d\mathbf{s} = \theta$

Another new quantity is introduced: the **magnetic voltage θ** :

1. The magnetic voltage θ is the magnetic potential difference on a closed path.
2. Since the magnetic voltage θ is valid for exactly one turn along our single wire, θ is also equal to the current through the wire:
 $\theta = I$ applies only to the long, straight conductor
3. The magnetic potential difference can take a fraction or a multiple of one turn and is therefore **not mandatorily** equal to I .
4. The magnetic voltage is generalized in the following box.

Notice:

The path integral of the magnetic field strength along an arbitrary closed path is equal to the free currents (= current density) through the surface enclosed by the path.

The magnetic voltage θ (and therefore the current) is the cause of the magnetic field strength.

This leads to the **Ampere's Circuital Law**

$\boxed{\oint_S \vec{H} \cdot d\vec{s} = \theta}$	<p>The magnetic voltage θ can be given as</p> <ul style="list-style-type: none"> $\theta = I$ for a single conductor $\theta = N \cdot I$ for a coil $\theta = \sum_n I_n$ for multiple conductors $\theta = \int_A \vec{S} \cdot d\vec{A}$ for any spatial distribution (see block15)
---	--

The unit of the magnetic voltage θ is **Ampere** (or **Ampere-turns**).

Notice:

$\oint_S \vec{s}$ and $\int_A \vec{A}$ in $\oint_S \vec{H} \cdot d\vec{s} = \theta = \int_A \vec{S} \cdot d\vec{A}$ build a right-hand system.

1. Once the thumb of the right hand is pointing along $\int_A \vec{A}$, the fingers of the right hand show the correct direction for $\oint_S \vec{s}$ for positive \vec{H} and \vec{S}
2. Currents into the direction of the right hand's thumb count positive. Currents antiparallel to it count negative.

Common pitfalls

- ...

Exercises

Task 3.2.3 Magnetic Potential Difference

Fig. 3: different trajectories around current-carrying conductors

Result **b)**

$$b) \oint_C \vec{H} \cdot d\vec{s} = 2 \text{ A} = (-2.5 \text{ A}) + (4.5 \text{ A}) \quad I = -2.5 \text{ A}$$

Given are the adjacent closed trajectories in the magnetic field of current-carrying conductors (see figure 3). Let $I_1 = 2 \text{ A}$ and $I_2 = 4.5 \text{ A}$ be valid.

In each case, the magnetic potential difference V_{m} along the drawn path is sought.

Path

- The magnetic potential difference is given as the **sum of the current through the area within a closed path**.
- The direction of the current and the path have to be considered with the righthand rule.

Exercise E13 Magnetic Voltage**(written test, approx. 6 % of a 120-minute written test, SS2021)**

The following images show cross-sections of electrical cables.

A closed path is shown as a dashed line. The magnetic voltage $\oint \mathbf{H} \cdot d\mathbf{s}$ on these paths shall be analyzed.

The following values are given for the currents:

- ```

\begin{align*}
I_1 &= 5 \text{ A} \\
I_2 &= 2 \text{ A} \\
I_3 &= 1 \text{ A} \\
I_4 &= 4 \text{ A}
\end{align*}

```
- $I_1 = 5 \text{ A}$
  - $I_2 = 2 \text{ A}$
  - $I_3 = 1 \text{ A}$
  - $I_4 = 4 \text{ A}$

Specify which magnetic voltages  $\theta_{(1)}$ ,  $\theta_{(2)}$ , and  $\theta_{(3)}$  result. Note the direction of the path in each case!

Path

For the resulting current the direction of the path has to be considered with the right-hand rule:

- $$I_{(1)} = +I_2 - I_1 - I_3 \quad \rightarrow \quad \theta_{(1)} = 2 \text{ A} - 5 \text{ A} - 1 \text{ A}$$
- $$I_{(2)} = +I_3 + I_4 - I_1 \quad \rightarrow \quad \theta_{(2)} = 1 \text{ A} + 4 \text{ A} - 5 \text{ A}$$
- $$I_{(3)} = +I_3 - I_4 - I_2 \quad \rightarrow \quad \theta_{(3)} = 1 \text{ A} - 4 \text{ A} - 2 \text{ A}$$

### Exercise E1 Magnetic Field Lines

**(written test, approx. 6 % of a 120-minute written test, SS2024)**

The following setup illustrates how a permanent magnet affects the H-field, based on the fundamental definition of the H-field.

- Four conductors are located perpendicular to the plane of the diagram

Result: All of them conduct a current with the same magnitude, but not in the same direction.

- A permanent magnet is located in between the conductors.

- The H-field is defined by currents  $\sum I = \int H \{ \text{r m d} \} s$  .
- In the permanent magnet, there are no free currents.
- The bound currents (of the permanent magnet) create also an H field.
- This exits on the north pole and enters the magnet on the south pole (similar to the B-field)\_
- $H = B/\mu$
- The H-field from task 1 gets distracted

### Exercise E1 Magnetic Potential

(written test, approx. 8 % of a 120-minute written test, SS2024)

Calculate the magnetic potential difference  $V_{\text{m}}$  for the following paths as shown by the solid lines.

Dotted lines are only for there for symmetry aspects!

The wires conduct the following currents:

- $|I_1| = 2 \text{ A}$
- $|I_2| = 5 \text{ A}$
- $|I_3| = 11 \text{ A}$
- $|I_4| = 7 \text{ A}$

Pay attention to the signs of the currents (given by the diagrams) and of the results!

## Result

Based on the right-hand rule and the part of a full revolution the following results:

1. Task:  $+I_1 - I_2 = -3 \text{ ~\rm A}$
2. Task:  $+{\frac{1}{4}} I_3 = 11/4 \text{ ~\rm A}$  (it does not matter which way the path goes from the startpoint to the endpoint, as long as it has the same direction and number of revolutions)
3. Task:  $-{\frac{1}{4}} I_1 = -0.5 \text{ ~\rm A}$
4. Task:  $+2 \cdot I_2 - 1 \cdot I_3 = -1 \text{ ~\rm A}$
